

7Eleven

Brand Overview

7Eleven is a global convenience retail chain operating 60+ stores in India under the JCP (JioCommerce Platform) ecosystem. As part of our engagement, we have built and delivered two strategic digital platforms that power 7Eleven's customer-facing communication and back-of-house operations across physical and online channels.

Scope of Work Delivered

1. 7Eleven.in — Brand Micro-Site

A dedicated micro-site that serves as 7Eleven India's official digital information hub. The platform is operated by the 7Eleven team and is used for ongoing customer communication.

Key capabilities delivered:

- **In-store offer publishing** — A self-serve content management workflow that allows the 7Eleven team to publish, update, and retire promotional offers running across their store network.
- **Contest terms & conditions** — A structured publishing module for legal disclosures, eligibility criteria, and T&Cs for any consumer contest or campaign run by the brand.
- **Nutritional information repository** — A product-level information layer that hosts nutritional data, ingredient details, and regulatory disclosures for products sold across 7Eleven stores, ensuring compliance with FSSAI labelling and consumer transparency expectations.

Business outcome: A single source of truth for all 7Eleven brand, offer, and product information that customers can reference, and that the brand can update independently without engineering dependency.

2. Restaurant Aggregator Application — Multi-Platform Order Management

A unified operations platform that allows 7Eleven to manage their entire store network across third-party food delivery aggregators (Zomato and Swiggy) from a single, consolidated touchpoint. This eliminates the operational overhead of managing each store's listing, menu, and orders independently on each platform.

Capabilities delivered:

ORDER PROCESSING & INVOICING

- **Custom invoice templates** — Channel-specific and category-specific invoice templates built for Zomato and Swiggy orders, with separate template logic for FMCG articles and Fresh articles, ensuring tax treatment and line-item formatting correctly reflect product type.
- **New order notification mechanism** — A persistent in-app notification and audible ringer that alerts store staff of incoming orders. The ringer re-triggers every 2 minutes until the order is acknowledged or actioned, eliminating missed-order risk during peak hours.
- **OTP & rider details for handover** — Order-level OTP capture and live rider details (name, contact) surfaced to store staff for frictionless order handover and direct rider contact in case of pickup delays or coordination issues.
- **Masked customer contact** — Store staff can connect with customers via a masked/proxy number to handle item unavailability, propose substitutes, or request reviews on the partner apps, while preserving customer privacy and remaining compliant with aggregator data-handling policies.

ACCESS & IDENTITY

- **Store-level and role-level access management** — Granular permissioning so that each user (store associate, store manager, area manager, central ops, finance) sees only the stores and modules relevant to their role, ensuring data hygiene and reducing operational error.

MENU MANAGEMENT

- **Independent menu creation per aggregator** — Separate menu authoring at category and sub-category level for Swiggy and Zomato, with the ability to apply store-level customizations where pricing, assortment, or availability needs to differ between locations.
- **Add-on item support** — Menu structure supports add-on items with independent pricing — base product and add-on are priced and tracked separately, enabling correct upsell economics and reporting.

STORE SERVICEABILITY

- **Slot-based weekly operating timings** — Store operational timing is configured at a slot level on a weekly schedule, accounting for in-day breaks, temporary closures, public holidays, and exception days, with the schedule reflected on both partner apps.

INVENTORY MANAGEMENT

- **Multi-channel inventory sync** — Both automated and manual inventory updates kept in sync across partner apps (Zomato, Swiggy), in-store POS transactions, and SAP, ensuring a single, accurate stock position regardless of where the depletion happened.
- **Category-level stock on/off** — Store staff can toggle entire categories offline in case of equipment or machinery failure (e.g., coffee machine down, hot food counter offline), preventing orders for items the store cannot fulfil.

SALES POSTING & FINANCIAL SYNC

- **Automated SAP sales posting** — Order-level sales data from both aggregators is automatically posted to SAP, with custom handling logic for customer-initiated cancellations and seller-initiated cancellations so that revenue, refunds, and reconciliation entries are correctly classified at source.

Business outcome: A consolidated operations console that reduces per-store manual effort, eliminates missed orders, ensures consistency across delivery aggregators, prevents revenue leakage from menu/inventory mismatches, protects customer data, and provides 7Eleven a single pane of glass for their full online food delivery business — with clean, automated downstream financial posting into SAP.

3. Operations & Analytics Dashboard

A unified analytics and monitoring dashboard layered on top of the aggregator application, giving 7Eleven's central operations and category teams real-time and historical visibility into the health of their online food delivery business.

Views delivered:

- **Order-level data** — Consolidated view of every order across stores and aggregators, with status, value, timing, and exception flags.
- **Item-level transaction data** — Granular item-wise sales and movement data across the network, enabling SKU-level performance analysis.
- **Order and cancellation trend charts** — Time-series visualizations of order volume and cancellation patterns, segmented by store, channel, and reason, for identifying operational bottlenecks and channel-level issues.
- **Inventory-level information** — Live and historical inventory positions that feed directly into demand sensing, supporting **inventory forecasting** and **item-level demand understanding** for replenishment planning and assortment decisions.

Business outcome: A decision-ready data layer that converts transactional activity into actionable insight, enabling 7Eleven to forecast inventory requirements more accurately, identify high-demand and underperforming SKUs, and proactively address operational issues before they affect customer experience.
