

Platform & Partnership Review — Fynd Konnect

Fynd × Reliance Retail Platform, Partners, Readiness

A consolidated view of work delivered across the JioMart, RBL, RRVL and Sephora ecosystem — May 2025 to May 2026.

1. EXECUTIVE SUMMARY

Fynd operates four foundational systems across the Reliance Retail ecosystem. Together they cover the 3P seller economy on JioMart, the SAP and accounting backbone for RBL's brand portfolio, the omnichannel loyalty programme for Sephora India, and a global marketplace gateway that allows any Reliance brand to expand internationally without bespoke build.

By the numbers

~800 Live 3P brands on JioMart via Fynd Omni	3–4L Monthly shipments processed	20+ RBL & RRVL brands powered	50+ Pre-built channel integrations
--	--	---	--

The pillars at a glance:

Pillar	What Fynd Operates	Reach
JioMart 3P Seller Platform	Fynd Omni — the connector that bridges JioMart's storefront, seller portal and inventory engine to every seller's OMS / WMS / ERP through a single integration contract.	~800 live brands · 3–4 lakh shipments / month
RBL Brand Operations	SAP and TIBCO integration layer for RBL's brand portfolio — covering inventory, orders, payments, returns, B2B compliance and loyalty postings.	20+ RBL & RRVL brands · Thousands of orders / day
Global Marketplace Reach	Fynd Konnect's marketplace gateway with 50+ pre-built channel integrations across India, Middle East and Southeast Asia.	50+ channels · 3 regions

Between May 2025 and May 2026, Fynd Konnect delivered thirteen major architectural and operational interventions for RBL — spanning a ground-up SAP order-posting redesign, GST-compliant B2B invoicing, real-time Kafka inventory pipelines for 10+ brands, full payment-method coverage including JioOnePay, end-to-end product exchange logic, and the Sephora Beauty Pass loyalty posting engine. Each intervention was either a precondition for safely onboarding a new brand at scale, a regulatory requirement, or a critical fix prompted by RRL leadership escalation.

This document records that work, the brands and channels it touches, the forward roadmap, and the additional capabilities Fynd Konnect can extend to any RBL brand on demand.

2. ENGAGEMENT OVERVIEW

2.1 The Four Pillars

Fynd's engagement with Reliance is best understood as four distinct but reinforcing platforms. Each is operated, owned and evolved by Fynd, and each carries its own scale, technical depth and commercial significance.

Pillar 1 — JioMart 3P Seller Platform (Fynd Omni)

The seller-side rail that brings every third-party brand onto JioMart through a single integration contract.

Included in scope:

- Powers ~800 live omni-seller brands — the long tail of fashion, lifestyle, F&B and hyperlocal categories on JioMart.
- Processes 3–4 lakh shipments per month with sustained growth.
- Bridges JioMart's three core systems — Sandstorm (inventory), Infibeam (catalogue and orders) and Morningstar / Hogwarts (storefront) — with every seller's choice of OMS, WMS or ERP.
- Normalises seven major aggregator platforms (Unicommerce, Vinculum, Increff, Browntape, EasyEcom, OMSGuru, Petpooja POS) into a single integration contract — eliminating per-seller builds.

Business Outcome

JioMart's 3P seller scale-up is operationalised through Fynd Omni. Sellers onboard once on Fynd Commerce, complete location and SKU mapping, and become transactable on JioMart immediately.

Pillar 2 — RBL Brand Operations (SAP / TIBCO Integration Layer)

The accounting and operational backbone that makes RBL's brand portfolio safe to scale on Fynd Commerce.

Included in scope:

- Owns the end-to-end SAP / TIBCO posting layer for RBL's brand portfolio — inventory, orders, invoices, credit notes, returns, payments and loyalty.
- Covers 20+ RBL and RRVL brands across Fashion, Beauty, Lifestyle and Furniture, including TUMI, GAP, WestElm, Pottery Barn, PB Kids, Sephora, Hamleys, Superdry, Ritu Kumar, TIRA, YOSTA, Performax, Reliance Trends, Freshpik, Swadesh and 7-Eleven India.
- Delivered thirteen major capability interventions in May 2025 — May 2026, spanning architecture redesign, GST compliance, payments expansion, real-time inventory modernisation and brand-specific enablement.
- Operates two dedicated Kafka clusters (Fynd cluster and SNG JCP cluster), processing hundreds of thousands of inventory events per day across 100+ stores per brand.

Business Outcome

RBL's brand portfolio can scale on Fynd without creating reconciliation, compliance or financial-reporting risk in RBL's SAP system.

Pillar 3 — Fynd Engage: Omnichannel Loyalty Platform

A standalone Fynd product — separate from Konnect and Commerce — purpose-built for retail loyalty and customer engagement at scale. Currently powering Sephora India's Beauty Pass programme; available for any RBL brand.

Included in scope:

- Standalone product line within the Fynd portfolio — not a feature of Konnect or Commerce.
- True single-ledger architecture: one member identity, one point balance, one tier structure across store, web and app.
- Full programme surface: tiered memberships, configurable earn and redeem rules, multiple reward types (points, discounts, e-gift cards, prepaid cards, experiential), personalised offers, gamification, referral programmes and analytics.
- Enterprise-grade integration: powers Sephora India's loyalty programme today, with full SAP-side posting integration for loyalty-liability accounting (delivered via Konnect).

Business Outcome

Sephora's loyalty programme runs cleanly at scale today. The same platform is available to power loyalty for any other RBL brand — without bespoke rebuild.

Pillar 4 — Global Marketplace Reach (Fynd Konnect)

A pre-built gateway of 50+ marketplace and channel integrations — ready to take any Reliance brand into any major retail market.

Included in scope:

- India: 30+ marketplaces including Amazon, Flipkart, Myntra, Nykaa, TataCliq — with support for multiple business models (FBA / FBF / Easy Ship / Self-Ship).
- Middle East: native integration with Amazon, Noon, Namshi, Styli and Trendyol.
- Southeast Asia: live integrations with Lazada, Shopee, TikTok Shop, Blibli and Tokopedia.
- New marketplace integrations are added continuously — brands plug in without bespoke development.

Business Outcome

Any RBL brand can be taken international or expanded to a new domestic channel using infrastructure that already exists.

2.2 Brands & Channels Powered

The cumulative reach of Fynd's engagement with Reliance, summarised.

Category	Brands & Entities Powered by Fynd
RBL Fashion & Lifestyle	TUMI, GAP, Superdry, Hamleys, Ritu Kumar, Pottery Barn
RBL Furniture	WestElm, Pottery Barn, PB Kids
RBL Beauty	Sephora India
RRVL Brands & Formats	Reliance Trends, YOSTA, Performax, TIRA, Freshpik, Swadesh, 7-Eleven India
Reliance Retail Formats	Nexus malls
JioMart Channel	~800 third-party omni-seller brands across Fashion, Lifestyle, F&B and Hyperlocal
Aggregator Partners	Unicommerce, Vinculum, Increff, Browntape (Ginesys), EasyEcom, OMSGuru, Petpooja POS

3. JIOMART 3P SELLER PLATFORM (FYND OMNI)

The JioMart Channel — referred to as Fynd Omni inside the JioMart teams — is the largest channel Fynd Konnect has built and operates on top of Fynd Commerce. It is the bridge between JioMart's three core systems and the seller's choice of OMS, WMS or ERP, and is directly responsible for JioMart's 3P seller scale-up.

3.1 Scale & Key Metrics

~800 Live omni-seller brands	3–4L Shipments per month	7 Aggregator platforms unified	3 Core JioMart systems integrated
---	---	---	--

Fynd Omni currently powers approximately 800 live seller brands across Fashion, Lifestyle, F&B and Hyperlocal verticals, processing 3 to 4 lakh shipments per month with sustained growth. The channel integrates JioMart's three core systems — Sandstorm (inventory), Infibeam (catalogue and orders) and Morningstar / Hogwarts (storefront) — and unifies seven major aggregator platforms behind a single seller experience.

3.2 Architecture — Konnect's Role

Fynd Omni abstracts JioMart's three core systems behind a single seller experience on Fynd Commerce. The integration contract is unified at the platform level so that every seller — regardless of which OMS, WMS or ERP they run — connects through one rail.

Figure 1. Fynd Konnect — stockpoints, sales channels and delivery partners flow.

How the integration works

End-to-end flow across inventory, catalogue, order and shipment status.

Included in scope:

- Inventory: flows from the seller's source-of-truth (Fynd OMS, third-party OMS / WMS / ERP, or aggregator) through Konnect into Sandstorm in real time.
- Catalogue and vertical mapping: handled through Infibeam.
- Orders: created on Fynd Omni from Morningstar / JCP and routed to the seller's fulfilment system.
- Shipment status: flows back to JioMart for LSP coordination and customer communications.
- Onboarding: sellers onboard once on Fynd Commerce, complete location and SKU mapping, and become immediately transactable on JioMart — without bespoke per-brand or per-aggregator integration work.

Business Outcome

JioMart can onboard any third-party brand or aggregator-managed seller with zero bespoke engineering effort and a predictable go-live timeline.

3.3 The Aggregator Ecosystem

RTI and hyperlocal sellers reach JioMart through key third-party platforms that Konnect normalises into a single integration contract. This eliminates per-seller builds and gives JioMart instant access to every brand already running on these platforms.

Aggregator	Coverage
Unicommerce	India's largest e-commerce enablement SaaS
Vinculum	Omnichannel OMS / WMS / PIM with built-in marketplace reconciliation
Increff	Fashion and lifestyle inventory and multichannel fulfilment SaaS
Browntape (Ginesys OMS)	Multi-channel order and inventory management for SMB sellers
EasyEcom	Omnichannel inventory and reconciliation across numerous ERPs
OMSGuru	OMS / IMS and reconciliation purpose-built for D2C sellers
Petpooja POS	India's largest F&B POS — unlocks the F&B hyperlocal category for JioMart Quick

Together these power the long tail of RTI sellers on JioMart and open the F&B hyperlocal category — without JioMart, or the sellers themselves, having to build a single seller-specific integration.

3.4 Roadmap

Near-term initiatives

Active programmes that extend the JioMart platform's reach and resilience.

Included in scope:

- Self-Ship for 1P JioMart sellers: UrbanLadder onboarding via a custom self-ship workflow — the same channel design becomes the reusable platform for future 1P omni-sellers managing their own logistics.
- Hyperlocal / JioMart Quick: Petpooja POS connector live; UrbanPiper and Rista POS connectors next — completing the F&B trio.
- Partner expansion: a continuously widening pipeline of WMS, OMS and POS connectors — keeping Fynd Omni the de facto seller-onboarding rail for every 3P omnichannel expansion on JioMart.

Business Outcome

JioMart's 3P seller capability stays ahead of demand — every new vertical, business model and seller archetype is supported on day one.

4. RBL & RRVL BRAND OPERATIONS — SAP / TIBCO INTEGRATION LAYER

Fynd Konnect operates the integration backbone that connects RBL's and RRVL's SAP, TIBCO and store-level systems to Fynd Commerce. This is the layer that decides whether RBL's brand portfolio can scale safely — it touches every order, every inventory event, every payment and every return.

13 Major capabilities delivered	20+ RBL & RRVL brands powered	12 Months of work (May 25 – May 26)	2 Dedicated Kafka clusters
---	---	---	--------------------------------------

Between May 2025 and May 2026, thirteen significant capability deliveries were completed — each either a precondition for new brand onboarding, a regulatory requirement, or a leadership-escalated production fix. They are organised below into six thematic groups.

4.1 Brand Portfolio Supported

Segment	Brands
RBL — Fashion & Lifestyle	TUMI, GAP, Superdry, Hamleys, Ritu Kumar
RBL — Furniture	WestElm, Pottery Barn, PB Kids
RBL — Beauty	Sephora India
RRVL — Reliance-owned formats	Reliance Trends, YOSTA, Performax, TIRA, Freshpik, Swadesh, 7-Eleven India
Reliance Retail Formats	Nexus malls

4.2 Twelve Months at a Glance

A single-page index of the thirteen capability deliveries — detail follows in 4.3 to 4.8.

#	Capability Delivered	Theme
01	SAP WM Migration — MDN to Delivery-Based Model (DBM) order posting	Foundation Architecture
02	B2B E-Invoice (IRN) Compliance for GST audit	Compliance & Finance
03	Product Exchange — end-to-end SAP posting with convenience-fee model	Brand Enablement
04	Multi-MOP Coverage — every payment method RBL uses	Compliance & Finance
05	Delivery Partner Own-Account Posting — COD and returns	Compliance & Finance
06	RRA Kafka Pipelines — new brands, server migration, SFTP → Kafka upgrade	Foundation Architecture

07	Skip Unchanged Inventory — performance optimisation	Performance & Ops
08	TIRA & Nexus Marketplace — new sales-channel enablement	Brand Enablement
09	RBL Furniture — full parity with Non-Furniture	Foundation Architecture
10	Sephora Beauty Pass — loyalty redemption in SAP posting	Loyalty & Programmes
11	JioOnePay / JioPay Multi-PG — new payment infrastructure support	Payments Modernisation
12	Split Payment Readiness — sales-posting preparedness	Payments Modernisation
13	EAN vs. Article Code — flexible inventory identifier at brand level	Brand Enablement

4.3 Foundation Architecture

Three foundational architecture deliveries that determine whether the brand portfolio can scale safely — every other capability sits on top of these.

Reliability of accounting at scale is the prerequisite for everything else. The DBM migration set that foundation.

01. SAP WM Migration — MDN to Delivery-Based Model (DBM)

A ground-up redesign of the order-posting architecture for RBL brands.

Included in scope:

- Previously, stock movement was posted in SAP on the basis of sales via POSDTA — architecturally misaligned with how SAP actually accounts for stock.
- Konnect migrated the trigger point to delivery confirmation — aligning posting with actual physical delivery and Post Goods Issue (PGI).
- Resolves persistent reconciliation mismatches that previously created ghost stock entries requiring manual correction.
- Validated first on TUMI; then progressively rolled out across all RBL brands — Non-Furniture, Furniture and TIBCO extensions — thousands of orders daily.
- Escalated by RIL leadership as a critical operational blocker; delivered to a hard deadline before broader brand rollout.

Business Outcome

The DBM became the prerequisite for safe brand onboarding. RBL can onboard any new brand on Fynd without introducing reconciliation risk into its SAP system.

06. RRA Kafka Pipelines — the inventory backbone, modernised

RRA (Reliance Retail Architecture) is the inventory backbone connecting RRL's SAP / WMS systems to Fynd. Significantly expanded across three workstreams in this period.

Included in scope:

- New brand pipelines enabled: YOUTA, TIRA, Freshpik, Reliance Trends, GAP, Performax — each with Kafka topics configured on the appropriate cluster (Fynd cluster or SNG JCP cluster) and brand-specific MOP code mappings where required.
- Critical infrastructure migration: Swadesh and 7-Eleven India migrated to new Kafka broker infrastructure (URLs, credentials, consumer groups) across UAT and Production — as the legacy RRA broker infrastructure was being retired. Any gap would have meant inventory stoppage for live, transacting brands.
- SFTP → real-time Kafka upgrade: WestElm, Pottery Barn and PB Kids migrated from batch SFTP file drops to real-time Kafka inventory consumption. Parent-child article structure (specific to WestElm's catalogue) replicated on the new infrastructure.
- Why the SFTP → Kafka upgrade matters: SFTP is fundamentally a batch operation — there is always a lag between actual stock movement in store and what customers see. For high-value furniture (sofas, dining sets), overselling due to stale inventory is a serious operational and customer-experience problem. Real-time sync collapses the inventory-accuracy window from hours to seconds.

Business Outcome

By end of period, the RRA Kafka infrastructure on Konnect was processing inventory events for 10+ RRVL brands across two dedicated clusters — hundreds of thousands of inventory update events per day across 100+ stores per brand.

09. RBL Furniture — full parity with Non-Furniture

WestElm, Pottery Barn and PB Kids brought to architectural parity with the rest of the RBL portfolio.

Included in scope:

- Migrated from a legacy TIBCO-only integration to the RDIP architecture — the same backbone as Non-Furniture.
- DBM (Delivery-Based Model) applied to Furniture orders.
- B2B and B2C transaction types correctly configured for all three brands.
- Transfer Order (TO) Confirmation made reliable — fixed an auth error that was silently dropping confirmations, which had been creating permanent inventory mismatches between physical delivery and SAP.
- Furniture orders are high-value (tens of thousands of rupees per order) and a missed posting creates a proportionally large financial discrepancy. WestElm's B2B corporate flow now goes through the correct posting path including IRN.

Business Outcome

Furniture is brought to full parity with Non-Furniture. Dual-maintenance overhead removed — one architecture across the entire RBL portfolio.

4.4 Compliance & Finance

Three deliveries that closed the regulatory and financial-accuracy gaps in RBL's posting layer — each either a statutory requirement or a leadership-escalated production fix.

02. B2B E-Invoice (IRN) Compliance for GST audit

The B2B posting layer is now fully GST-compliant — every B2B sale, cancellation and reversal is IRN-aware.

Included in scope:

- For B2B orders, the system mandatorily checks for a valid IRN (Invoice Reference Number from the GST IRP portal) before triggering any sales posting to SAP or TIBCO.
- Orders without a valid IRN are held until one is generated — no non-compliant entries reach SAP.
- Cancellations and reversals are IRN-aware: no reverse posting happens without a valid credit-note IRN in place.
- Enforced at bag_invoiced, cancelled and credit-note states — full lifecycle coverage.
- Covers all RBL brands with B2B operations — WestElm corporate, institutional furniture, Sephora business customers.

Business Outcome

Fynd Konnect is now a GST-compliant B2B posting engine, not just a sales sync tool. RBL's B2B revenue cannot create audit liability through Fynd.

04. Multi-MOP Coverage — every payment method RBL uses

Systematic SAP and TIBCO posting support for every payment method and tender type RBL accepts across channels.

Included in scope:

- Payment methods covered include: Flipkart prepaid, Myntra PPMP, COD with delivery-partner own-account settlement, Qwiksilver gift cards, JioPay, JioOnePay, multi-PG (Razorpay + JioOnePay simultaneously), BharatPay QR and price-adjustment MOPs.
- Each requires its own SAP tender code, GL mapping and transaction-type — validated against RBL's chart of accounts.
- Solved RBL's own-account COD settlement model — where the delivery partner collects cash and remits to RBL directly, requiring a different tender mapping from standard COD.
- Covers 10+ distinct payment methods and tender types across all RBL brands and channels.

Business Outcome

Every rupee of revenue lands in the correct GL account in SAP from day one — every new channel or PG can be activated without creating financial gaps that need manual rectification.

05. Delivery Partner Own-Account Posting — COD and Returns

Delivered to a leadership ultimatum: fix DP own-account COD posting before the weekend or RBL store-level operations would be blocked.

Included in scope:

- RBL operates a model where delivery partners (Delhivery, Xpressbees, etc.) collect COD cash and settle directly with RBL — not via Fynd's payment gateway.
- Konnect built specific tender-code mapping for this flow so that COD postings correctly reflect the delivery partner as the collecting entity.
- Same logic extended to return orders — reverse postings reference the DP's tender code, not a generic prepaid reversal.
- First validated on TUMI over a single weekend with RIL's team monitoring; rolled out across the RBL portfolio post sign-off.

Business Outcome

RBL's COD revenue stream — a meaningful share of total revenue, especially in Tier-2 / Tier-3 markets — is now reconcilable with delivery partners at scale.

4.5 Payments Modernisation

Two deliveries that align Konnect's posting layer with Reliance's strategic payments roadmap — JioOnePay live, Split Payment readied.

11. JioOnePay / JioPay Multi-PG support

Posting layer brought live for Reliance's own payment gateways across RBL storefronts.

Included in scope:

- Built MOP mapping for JioOnePay and JioPay payments in SAP and TIBCO.
- Resolved posting failures specifically when BharatPay QR was enabled alongside other gateways — a multi-MOP scenario the existing logic had not accounted for.
- Multi-PG support: a single order can be paid partly through JioOnePay and partly through Razorpay, and each leg posts to the correct GL.
- Delivered to an RBI compliance deadline flagged at programme level — had the migration to JioPay missed the date, RBL StoreOS operations would have been shut down.

Business Outcome

Reliance's own payment product can be scaled across RBL storefronts without any gap in the downstream financial accounting.

12. Split Payment Readiness

Proactive posting-layer assessment ahead of the platform's Split Payment launch.

Included in scope:

- Fynd Platform introduced Split Payment in April 2026 — enabling customers to pay using two methods simultaneously (e.g. half by card, half by UPI; or loyalty points plus card).
- Konnect proactively assessed the impact on RBL's sales posting — identifying multi-MOP SAP payload changes and tender-code logic needed before any RBL brand goes live with the feature.
- Avoids a recurrence of the historic pattern where every new payment capability has caused posting failures discovered only after go-live.

Business Outcome

When RBL brands adopt Split Payment, the SAP posting layer is ready on day one — no financial gap created by the new feature's adoption.

4.6 Brand & Channel Enablement

Three deliveries that opened new revenue streams or fixed brand-specific blockers — each tied to a specific RBL or RRVL business priority.

03. Product Exchange — end-to-end SAP posting with convenience-fee model

Native product exchange on RBL storefronts — with the convenience-fee model RBL specifically required.

Included in scope:

- Customer returns one product and picks up another; the price difference is handled as a convenience fee, not a store credit — aligning with RBL's accounting structure (no liability on books).
- Konnect built the full posting logic: detection of exchange type from payload, correct tender amount calculation including the convenience fee, tax-slab logic (5% GST when product price plus fee falls below ₹2,500), and accurate posting to both SAP and TIBCO.
- Tested on GAP, TUMI, WestElm; being rolled out across the portfolio.

Business Outcome

RBL brands offer a seamless in-app exchange experience without any manual SAP intervention. Convenience fees appear correctly as revenue — not silently lost.

08. TIRA & Nexus Marketplace — new sales-channel enablement

SAP and TIBCO posting codes configured for two new Reliance retail entities going digital on Fynd.

Included in scope:

- Nexus operates under a distinct company ID in Reliance's SAP — own MOP codes, GL accounts, transaction-type mappings.
- TIRA required specific POSDTA SAP codes aligned with how Reliance classifies beauty-category revenue.
- Each Reliance retail business is a separate profit centre in SAP — day-one accuracy was non-negotiable.
- TIRA is a strategic priority, competing in the organised beauty retail space; Nexus represents premium real-estate retail.

Business Outcome

Both formats went live on Fynd with correct SAP postings from day one — no month-close surprises, no GL-mapping rework.

13. EAN vs. Article Code — flexible inventory identifier at brand level

A self-serve, brand-level configuration for the inventory identifier convention.

Included in scope:

- Different RRVL brands use different identifiers as their primary SKU reference — some on EAN (GAP, Reliance Trends), others on internal article code (ALU).

- Konnect built a company-level configuration toggle in the RRA extension — each brand specifies its identifier without any code change.
- Resolved a GAP launch issue where a setup miscommunication had the brand configured on EAN while products were catalogued on ALU — inventory simply was not flowing.
- Net effect: zero-touch onboarding for any future brand regardless of identifier convention.

Business Outcome

Inventory flow is Day-1 infrastructure for any new brand — no engineering dependency, no multi-crore visibility gap from identifier mismatches.

4.7 Loyalty & Customer Programmes

10. Sephora Beauty Pass — loyalty redemption in SAP posting

Full posting-layer support for Sephora India's Beauty Pass loyalty programme — paired with the Fynd Engage loyalty platform (Pillar 3).

Included in scope:

- Members can redeem points as payment at checkout — e.g. ₹700 cash plus ₹300 in points.
- Konnect built and iterated the full loyalty posting logic: redemption on the forward order (placed event), discount handling in the delivery event, boutique-product-specific posting (Sephora's artisanal products follow different pricing and discount rules), and full-or-partial loyalty reversal on returns.
- Phase 2 extended to mixed carts containing both regular and boutique products — two separate posting sequences with distinct sequence numbers to avoid SAP duplication.
- Sephora India processes thousands of loyalty redemptions per month — manual reconciliation was unsustainable at this volume.

Business Outcome

Sephora's finance team can reconcile its loyalty liability automatically. Sephora can scale online sales without creating a finance-operations bottleneck.

4.8 Performance & Operational Excellence

07. Skip Unchanged Inventory — performance optimisation at RRL scale

Suppress inventory events for unchanged quantities across all RRA supply extensions.

Included in scope:

- Previously, every inventory sync pushed all records through Kafka — regardless of whether quantity had actually changed. 500 unchanged articles meant 500 unnecessary events.
- Konnect introduced a 'suppress unchanged inventory' check across all RRA supply extensions — events are filtered before they enter the Kafka pipeline.
- At RRL's scale (thousands of stores, tens of thousands of articles per brand), this materially reduces Kafka consumer load and processing overhead on both Fynd and RRL's SAP / WMS.
- Particularly impactful during peak sale events (End of Reason Sale, Big Fashion Festival), when actual order events were previously competing with unchanged-inventory noise for consumer capacity.

Business Outcome

Faster processing of real changes, lower infrastructure cost, and a more stable pipeline during exactly the high-traffic periods when reliability matters most.

5. FYND ENGAGE — OMNICHANNEL LOYALTY PLATFORM

Fynd Engage is a standalone product within the Fynd portfolio — separate from Fynd Konnect and Fynd Commerce — built specifically for retail loyalty and customer engagement at scale. It currently powers Sephora India’s Beauty Pass programme. The same platform is available for any RBL brand looking to deploy or modernise its loyalty programme.

True omnichannel loyalty means one identity, one point balance, one tier — not three siloed stacks pretending to be one.

5.1 The Architecture Bet — Why Engage Is Different

Most retail loyalty programmes claim to be omnichannel. Very few actually unify the data layer. The result, in those cases, is the same shopper holding three different point balances depending on where they last earned, with periodic reconciliation jobs trying to keep them in sync — and a finance team that cannot trust its own loyalty-liability number on any given day.

Engage avoids that architecture entirely. There is one ledger, one identity, one tier — and every channel reads from and writes to that single source of truth in real time. Member behaviour on the storefront app updates the same ledger that the in-store POS reads. Loyalty earned in a brick-and-mortar Sephora store is redeemable on the website thirty seconds later. Returns reverse against the original earn event — without spreadsheets, without manual journal entries.

5.2 Platform Capabilities

What Engage delivers as a platform

The capability surface available to any brand running a loyalty or referral programme on Engage — not just Sephora-specific.

Included in scope:

- Programme design: tiered memberships, configurable earn rules (purchase, referral, sign-up, custom triggers), configurable redeem rules (checkout redemption, partial redemption, redemption caps).
- Reward types: loyalty points, discounts, e-gift cards, prepaid cards, experiential rewards — mix and match per programme.
- Engagement mechanics: personalised offers, gamification elements, referral programmes, milestone-driven rewards.
- Member experience: unified identity across store, web and mobile app — a single point balance the member sees regardless of channel.
- Programme operations: dashboard for programme performance, customer engagement analytics, reporting on retention, repeat-purchase and redemption activity.
- Brand customisation: visual editor lets each brand reflect its own identity inside the loyalty experience — not a generic Engage skin.

- Integration surface: native with Fynd Commerce; bridges to SAP, ERP and finance systems via Konnect for liability-tracking and posting at enterprise scale.
- Channel deployment: programmes can be deployed across store, web and mobile app from one configuration.

Platform Outcome

A single loyalty platform that handles end-to-end programme lifecycle — from member identity through earn, redeem, tier, reversal and accounting — with no integration debt left to the brand's engineering team.

5.3 Live at Sephora India — The Flagship Deployment

Sephora India runs Beauty Pass on Fynd Engage. This is the platform's flagship enterprise deployment and the proof point that the architecture works under real volume and real complexity — with the SAP integration patterns delivered through Konnect (capability 10 in section 4).

What Engage operates for Sephora India today

End-to-end Beauty Pass programme across store, web and app — with full enterprise SAP integration.

Included in scope:

- Unified Beauty Pass member identity, point balances and tier status across every Sephora touch-point — a true single source of truth.
- Earn flows: points credited on store, web and app purchases through one ledger; consistent member view regardless of where the transaction happened.
- Redeem flows: members redeem points as payment at checkout on any channel — e.g. ₹700 cash plus ₹300 in points — with the correct accounting treatment posted to SAP.
- Boutique product handling: Sephora's artisanal product range follows distinct pricing and discount rules; the platform handles these natively.
- Mixed-cart logic: orders containing both regular and boutique items are processed with separate posting sequences to maintain SAP integrity.
- Returns and reversals: full and partial loyalty reversals on returns — keeping the loyalty ledger and SAP liability ledger always in sync.
- Volume: thousands of redemptions per month flowing through the platform with automated reconciliation against Sephora's SAP — no manual liability tracking.

Strategic Outcome

Sephora India's loyalty programme behaves as one programme — not three siloed stacks. Members get a consistent experience; finance gets clean reconciliation; the brand can scale online sales without creating an operations bottleneck.

5.4 What This Means for RBL — Platform-Led Loyalty Across the Portfolio

The most strategically useful framing of Engage for RBL is not “a loyalty programme that Sephora uses.” It is a loyalty platform with a proven enterprise deployment, sitting ready for the rest of the brand portfolio.

The platform that runs Beauty Pass cleanly today can run loyalty for TUMI, GAP, WestElm, Hamleys, Pottery Barn, Superdry or any other RBL brand — without rebuild.

Why portfolio-level Engage rollout is straightforward

What's already proven, and what makes new brand deployments fast.

Included in scope:

- Architecture is proven at Sephora's scale — thousands of redemptions per month, mixed cart complexity, full SAP integration.
- SAP / TIBCO posting layer is already built (Konnect capability 10) — every new RBL brand inherits the loyalty-liability accounting treatment without bespoke development.
- Multi-channel deployment template (store + web + app) is operationally proven — new brands plug into the same pattern.
- Brand-specific differentiation is configurable: each brand customises tier names, earn rules, reward types and visual identity through the platform's configuration layer.
- B2B loyalty extensions: where a brand has a B2B segment (e.g. WestElm corporate, institutional buyers), Engage's programme rules can be extended; the SAP B2B posting integration is already in place via Konnect (capability 02).

Strategic Outcome

Every RBL brand can have a real omnichannel loyalty programme without bespoke engineering build — on a platform that has proven itself at Sephora's scale.

6. MARKETPLACE & CHANNEL REACH (FYND KONNECT)

Beyond the systems already operating across the Reliance ecosystem, Fynd Konnect is a marketplace gateway with 50+ pre-built channel integrations spanning marketplaces, storefronts, ERP, WMS, POS and payment systems — across India, Middle East and Southeast Asia. Any RBL brand can be expanded onto a new channel — domestic or international — using infrastructure that already exists.

50+ Pre-built integrations	25+ Live marketplaces	12+ Countries covered	3 Major regions
--------------------------------------	---------------------------------	---------------------------------	---------------------------

This section sets out the architecture of Konnect, the live channel coverage by region, the quick-commerce ingestion model, and the channels currently in development.

6.1 Architecture Overview

Konnect sits between the seller's back-end (ERP, OMS, WMS, POS, logistics, payments) and the full surface of sales channels (marketplaces, storefronts, quick commerce, physical stores). It exposes a single integration contract — the seller integrates once, and any new channel becomes available without bespoke build.

Figure 2. Fynd Konnect ecosystem — marketplaces, storefronts, ERP, WMS, POS and Store OS, all behind one integration contract.

6.2 India — Live Marketplaces

Konnect supports the full surface of major Indian marketplaces — including, for the largest platforms, multiple distinct integration models. The detail matters: Amazon and Myntra each

operate several fundamentally different marketplace models, and a brand sells through them differently. Konnect is built for that reality.

Marketplace	Integrations Live on Konnect
Amazon	Amazon Seller Central (SC) · Amazon Multi-Location Fulfilment (MLF) · Amazon Vendor Direct Fulfilment (VDF) · Amazon FBA · Amazon B2B · Amazon Retail B2B
Flipkart	Flipkart Omnichannel · Flipkart Multichannel
Myntra	Myntra Omni · Myntra PPMP (Pure Play Marketplace)
Nykaa	Nykaa · Nykaa Fashion
TataCliQ	TataCliQ · TataCliQ Luxury
AJIO	AJIO — true omnichannel integration (store-level inventory live to AJIO storefront)
JioMart	JioMart — complete marketplace integration
FirstCry	FirstCry — omni-channel marketplace for mother and baby category
LimeRoad	LimeRoad — fashion-forward social commerce platform
Inorbit	Inorbit — retail mall network integration
Google LIA	Google Local Inventory Ads — in-store inventory feed for nearby-shopper discovery
Meesho	Meesho — social-commerce marketplace and value retail

6.3 Quick Commerce — PO-Based Channel Ingestion

Quick commerce platforms generally do not expose marketplace APIs the way Amazon, Flipkart or Myntra do — most operate B2B, with brands receiving purchase orders by email and managing fulfilment offline. This is a real gap for any brand wanting a single operating view across all its sales channels.

Konnect closes this gap with a PO-based ingestion model. The brand connects its order-receiving mailbox to Konnect; incoming POs from quick-commerce partners are read automatically; the order is created in the Konnect dashboard alongside marketplace and storefront orders; and the brand's operations team processes everything from one common interface.

Quick Commerce — unified operations without channel APIs

Email-based purchase order ingestion that brings non-API channels into the same operating dashboard as every other Konnect channel.

Included in scope:

- Channels currently supported via PO-based ingestion: Blinkit, Instamart, Zepto, Tata 1mg, and several other quick-commerce partners.
- Mechanism: a dedicated mailbox per brand or per partner is connected to Konnect; incoming purchase orders are parsed automatically and converted into orders in the Konnect order book.

- The brand's operations team processes these orders alongside marketplace and storefront orders — same dashboard, same SLA tracking, same inventory rules.
- No partner-side API dependency: works whether or not the quick-commerce platform exposes a developer API.

Business Outcome

Quick commerce becomes a first-class channel in the brand's operating view — not a side workflow tracked in spreadsheets and inboxes.

6.4 Middle East

Native marketplace integrations for Middle East expansion. Together these channels cover the major Gulf and Levant retail markets — UAE, Saudi Arabia, Egypt, Kuwait, Qatar, Bahrain, Oman and Jordan — plus Trendyol's wider GCC and European footprint.

Marketplace	Coverage
Amazon (ME)	Amazon UAE and Amazon KSA — native integration covering both fulfilment models
Noon	Marketplace integration across UAE, KSA and Egypt
Namshi	Fashion marketplace serving the GCC — UAE, KSA, Kuwait, Qatar, Bahrain, Oman
Styli	Fashion marketplace across MENA — KSA, UAE, Egypt and adjacent markets
Trendyol	Cross-border fashion and lifestyle marketplace — Turkey, GCC and European markets

Country coverage at a glance: United Arab Emirates · Saudi Arabia · Egypt · Kuwait · Qatar · Bahrain · Oman · Jordan · Turkey (via Trendyol).

6.5 Southeast Asia

Live integrations with the major Southeast Asian marketplaces — covering both established e-commerce platforms and emerging social commerce.

Marketplace	Coverage
Lazada	Pan-SEA — Singapore, Malaysia, Thailand, Vietnam, Indonesia, Philippines
Shopee	Pan-SEA — the largest e-commerce platform in the region
TikTok Shop	Pan-SEA social-commerce channel with rapid growth
Blibli	Indonesia
Tokopedia	Indonesia

6.6 Storefronts

Konnect operates as the order-and-inventory backbone behind enterprise-grade storefront platforms — alongside Fynd’s own Storefront product.

Platform	Notes
Adobe Commerce	Enterprise-grade storefront platform — Konnect centralises order, inventory and catalogue management
Salesforce Commerce Cloud	Enterprise storefront platform — Konnect centralises operations across stores
Shopify	D2C storefront platform — unified order and inventory management via Konnect
Fynd Storefront	Native Fynd storefront builder — deepest integration with the rest of the Fynd platform

6.7 Channels in Development

A continuously expanding pipeline of new channel integrations. Each addition becomes immediately available to every Konnect-integrated brand — no per-brand build required.

Channel	Region	Notes
Snapdeal	India	Marketplace integration in active development
Flipkart — Fulfilled by Flipkart	India	Adding Flipkart’s FBF fulfilment model alongside the existing Flipkart Omni and Multi integrations
Nykaa Fashion B2B	India	B2B extension to the live Nykaa Fashion integration
JioMart Self-Ship	India	1P JioMart self-ship channel — first use case: UrbanLadder; reusable for other 1P sellers
eXtra	Middle East	Electronics and home appliances marketplace — KSA-led, with regional reach
Zilo	India	Fashion-forward Quick Commerce
ASOS	United Kingdom	Fashion marketplace integration — priority for RBL brands targeting the UK fashion segment
Next	United Kingdom	Fashion and lifestyle marketplace integration
BigCommerce	Storefront	Coming-soon storefront platform integration
WooCommerce	Storefront	WordPress-based storefront integration in development
