

RCPL DMS Project

Comprehensive Knowledge Base & Project Analysis

Reliance Consumer Products Limited — Distribution Management System

10 Documents Analyzed	6 Core Modules Covered	Full Breakdown Scope + Roadmap
---------------------------------	----------------------------------	--

RCPL DMS — Project Overview

RCPL (Reliance Consumer Products Limited) DMS (Distribution Management System) is an end-to-end digital platform built to manage the entire supply chain from primary ordering (factory to distributor) to secondary ordering (distributor to retailer). It digitizes every stakeholder interaction — CSOs, distributors, retailers, sales teams, finance, and logistics — into a single connected ecosystem.

Platform	URL / Details
Admin Portal (Prod)	https://portal.reliancedms.com/login
Admin Portal (UAT)	https://jio-dms-service.extensions.jmpx3.de/login
Distributor Platform	https://reliancedms.jiomartpartners.com
CSO App (Web)	https://rcpl.jmpx3.de
Saarthi Platform	https://saarthi.reliancedms.com/
CMS Platform	https://platform.jiomartpartners.com/
CTS / Cooler System	https://jio-dms-service.extensions.jmpx3.de/asset-management-login

Ecosystem Map — Key Stakeholders

Stakeholder	Role in DMS
FOS / CSO	Field Officer / Channel Sales Officer — onboard retailers, place secondary orders, raise cooler requests
ASE / ASM	Area Sales Executive / Manager — approve requests, manage beat territories
Distributor	Accepts/rejects/modifies secondary orders; places primary orders to RCPL
RCPL Business Team	Admin panel access; uploads pricing, mappings, schemes
Finance Team	Upload pricing; approve financial validations in CTS flow
BPO Teams	Handle compliance, CCO creation, delivery challans in cooler lifecycle
Service Provider	Execute cooler delivery and installation in the field
Saarthi Sales Team	ASM/ASE who place assisted primary orders on behalf of distributors
Retailer	End customer who receives secondary orders from distributor

1. SOP — RCPL CSO App

TYPE: SOP

PLATFORM: Mobile App

USER: CSO / Sales Team

Summary

The RCPL CSO App is a mobile application for Channel Sales Officers to onboard retailers, manage beats, capture secondary orders, and track order status. It is the primary field-facing tool in the secondary order flow.

Scope (Current)

What is in scope today
→ Retailer onboarding via OTP-verified mobile number with store board image capture
→ Beat management — view today's, tomorrow's, and monthly beat plans
→ Mapping newly onboarded retailers to distributors and beats
→ Secondary order booking — browse by category or brand, add to cart, place order
→ View order history and statuses (Requested, Confirmed, Rejected)
→ Off-beat orders for retailers outside the assigned beat
→ Productivity statistics per beat

Functional Breakdown

Feature	Detail
Login	OTP via mobile number; APK download link provided
Retailer Onboarding	Mobile OTP verification → fill Owner Name, Store Name, Type, Billing, Region, Channel, GSTIN, Address, Store image
Beat Mapping	Select distributor + beat from dropdowns after onboarding
Beat View	Calendar view — Today / Tomorrow / Monthly with retailers listed
Order Booking	Category or brand browsing → product listing with MRP, margin, schemes → cart → Request
Order Confirmation	Success screen with Order ID, Amount Payable, Savings displayed
Order History	List view with Requested / Confirmed / Rejected statuses; Reorder option

Scope — Future

Potential future enhancements
→ Geolocation capture at retailer visit (partially present — 'Capture Geolocation' visible in

screenshots)
→ Push notifications for order status updates
→ Offline mode for areas with poor connectivity
→ Retailer-level sales analytics and history for CSO
→ In-app incentive tracker for CSO onboarding targets
→ Returns and claims initiation from CSO app

Roadmap / Planning

Phase	Activities
Setup (T-4 to T-3)	Download APK, CSO onboarding via Admin Panel (FOS Onboarding), CSO-Distributor mapping, CSO-Retailer mapping
Pre-Launch (T-2)	Beat plan upload for all CSOs, verify article catalog is live, confirm pricing
Go-Live (T0)	CSO begins field visits, retailer onboarding, beat-based ordering
Ongoing	Monitor beat productivity, off-beat orders, order confirmation rates

Development & QA Notes

- UAT URL: <https://rcpl.jmpx3.de> — usable on laptop browser for testing
- Prod URL: <https://reliancedms.jiomartpartners.com>
- APK distribution managed externally via Google Drive link
- OTP validation for both CSO login and retailer onboarding must be tested
- Beat plan reflects data uploaded via Admin Panel — sync latency should be validated
- Cart pricing recalculates on quantity change — test ladder scheme triggers

2. SOP — Signature Retailer Onboarding

TYPE: SOP	PLATFORM: Multi-module	USER: Acquisition CSO + ASM + Distributor
-----------	------------------------	---

Summary

This SOP covers the full Signature Retailer program — a premium onboarding process for high-value retailers (Signature merchants). It involves 4 modules: DMS Admin Panel, DMS Approval Panel, CSO App (Acquisition + Order Taking), and the Distributor Platform. The Signature flow has significantly more data capture than standard retailer onboarding, including bank details, personal ID, GSTIN, and commercial/branding details.

Scope (Current)

Signature Program In-Scope
→ Admin Panel: Bulk upload for all user types, mappings, pricing, schemes, beat plans
→ Acquisition CSO: 5-section onboarding form — GSTIN, Business, Personal, Bank, Commercial details
→ Penny drop bank validation (Reliance deposits INR 1 to verify account)
→ GSTIN auto-population of business details upon validation
→ Outside and inside shop branding details capture (backlit board, non-lit board, façade pillars, cash counters)
→ DMS Approval Panel: ASM reviews and approves/rejects Signature applications with reason codes
→ Order Taking CSO: Segment selection, beat-based assisted ordering
→ Distributor Platform: Accept/Modify/Reject retailer orders, download invoices and picklists

Onboarding Data Captured — Signature vs Standard

Field Category	Signature Details
GSTIN	Full GSTIN validation with auto-populate; skip option for non-GST retailers
Business Details	Type of Ownership, Merchant Type, Segment, Sub-segment, Store Name, Type of Outlet, Region, Billing Address, Shipping Address, Store inside/outside images
Personal Details	Seller Name, Aadhar Card (masked only), Document images, Owner photo
Bank Details	Account No., Account Name, Bank Name, IFSC, Cancelled cheque/passbook image — Penny Drop validation
Commercial Details	Avg Monthly Sales (FMCG Food, Beverages, General Merchandise), No. of windows, Cost per window, GSB Rental, Branding selections

Branding	Dealer board (backlit/non-lit/façade pillars with brand+dimensions), In-shop branding (cash counter, racks, etc.)
-----------------	---

Approval Panel Flow

Stage	Action
For Approval	ASM reviews retailer application — all 4 sections visible
Pending From Retailer	Waiting for retailer to complete a section
Approved	Application approved — retailer activated
Rejected	Rejection reasons: images missing, PAN unclear, bank mismatch, ID proof issues
Commercials Input	ASM enters branding cost inputs per agreement before approving

Scope — Future

Future Signature Program Enhancements
→ Digital agreement signing by retailer (currently physical signature + upload)
→ Automated penny drop retry on failure
→ Merchant credit scoring using commercial data (monthly sales, branding investment)
→ Progressive disclosure form — reduce friction for small merchants
→ Real-time application status tracker visible to Acquisition CSO
→ Scheme visibility for Signature-exclusive offers in Order Taking CSO app

Development & QA Notes

- GSTIN validation API integration must handle network timeouts gracefully
- Penny drop validation: Test success, failure, and retry scenarios
- Image upload: Test masked Aadhar enforcement — system should reject unmasked Aadhar
- Approval Panel: Test role-based access — only designated ASMs should see their territory's applications
- Branding cost inputs in Approval Panel must feed downstream into commercial settlement calculations

3. SOP — Saarthi (Assisted Ordering Platform)

TYPE: SOP	PLATFORM: Web (Mobile Browser)	USER: ASM / ASE Sales Team
-----------	--------------------------------	----------------------------

Summary

Saarthi is a mobile web application enabling RCPL sales team members (ASM/ASE) to place primary orders on behalf of distributors. It acts as an assisted ordering interface — the sales team member logs in, selects a distributor from their mapped list, and is auto-logged into the distributor's ordering platform to place the order.

Scope (Current)

What Saarthi covers today
→ Sales team onboarding via Admin Panel (Type: Saarthi, Sub-Type: Sales Team)
→ Distributor onboarding and mapping to sales team (Type: Saarthi, Sub-Type: Sales Team Merchant Mapping)
→ Sales team login via mobile number + OTP at https://saarthi.reliancedms.com/
→ View and search distributors by ID, name, or mobile number
→ Click 'Order Now' to auto-login into the distributor's DMS portal
→ Place full primary order: select category, add products, complete order with all checks

Scope — Future

Anticipated expansions
→ Order tracking and status visibility from Saarthi dashboard
→ Sales team performance dashboard — orders placed per distributor, fill rates
→ Push notifications for pending distributor orders needing assisted ordering
→ Offline capability for areas with poor connectivity
→ Multi-distributor bulk order assistance in single session
→ Integration with Saarthi for secondary order assistance (currently primary only)

Roadmap / Planning

Step	Activity
Step 1	Onboard all RCPL distributors via Admin Panel (Type: Onboarding, Sub-Type: Distributor Onboarding)

Step 2	Onboard sales team (ASM/ASE) via Admin Panel (Type: Saarthi, Sub-Type: Sales Team)
Step 3	Map distributors to sales team (Type: Saarthi, Sub-Type: Sales Team Merchant Mapping)
Step 4	Sales team logs in and begins placing assisted primary orders
Step 5	Monitor via Admin Panel order management for primary indent tracking

Development & QA Notes

- Auto-login from Saarthi to Distributor Portal must be tested for session security — ensure tokens are scoped correctly
- Search functionality: Test partial match on distributor ID, name, and mobile
- Admin Panel: Sales Team Merchant Mapping upload — validate many-to-one mappings (one ASM to many distributors)
- Concurrent session handling: What happens if distributor is already logged in when Saarthi auto-logs in?

4. SOP — Primary DMS Onboarding & Admin Data

TYPE: SOP + Process Flow

PLATFORM: Admin Portal

USER: Admin / ASM / Business Team

Summary

This document covers the 5-step process for RCPL distributors to place primary orders on the DMS, and the full setup required before distributors can go live. It maps out the T-4 to T0 timeline for territory enablement with detailed steps at each stage.

Primary DMS Setup Timeline

Milestone	Activities Required
T-4 (Territory Selection)	Distributor data downloaded from ERP, validated by Sales Team, shared with Naveen Uppara to upload into DMS
T-3 (Data Population)	1. Distributor onboarding 2. Upload Network file 3. Upload Vehicle master 4. Upload Vehicle mapping at site 5. Upload Article to site mapping
T-2 (Readiness Check)	1. Check SKU availability at plant level 2. Pricing check 3. Distributor-to-site mapping check 4. Confirm distributor ordering plan with ASMs
T-1 (Finance & Supply Chain)	1. Finance check 2. Pricing check 3. Supply chain data upload 4. All checks confirmed
T0 (Go Live)	1. ASMs enabled 2. Assistance to distributors for placing primary orders 3. Order punching begins

5-Step Distributor Ordering Process

Process flow for distributor to place primary order
→ Step 1: Login via OTP to DMS at https://reliancedms.jiomartpartners.com
→ Step 2: Check available balance (credit limit) before ordering
→ Step 3: Add SKUs — order by category, add required quantities to cart
→ Step 4: Match SKU quantity basis FTL (Full Truck Load) criteria
→ Step 5: Check ship-to address → recheck order details → Place Order

Admin Portal — Upload Types Reference

Type	Sub-Types Available
ONBOARDING	Distributor Onboarding, Distributor Address, CFA Onboarding, RCPL APOB Onboarding, RCPL Factory Onboarding, FOS Onboarding, Retailer Onboarding, RCPL Team Onboarding

PROMISE_NETWORK	Vehicle Type Master, Vehicle Site Mapping, RCPL Network, RCPL FDP, RCPL Vehicle Site Mapping
Primary Indent Management	View all orders, Approve / Modify / Change Fulfillment Centre / Reject

Scope (Current)

Current capabilities
→ Full distributor onboarding via bulk Excel upload
→ RCPL APOB and Factory site onboarding
→ Network file mapping (distributor-to-site relationships)
→ Vehicle master and vehicle-site mapping for delivery routing
→ Primary indent management — approve, modify, change fulfillment centre, reject orders
→ Primary ordering by distributor with FTL guidance and balance check

Scope — Future

Future enhancements
→ Automated ERP-to-DMS data sync (currently manual extraction and upload)
→ Real-time FTL optimization suggestions based on route and vehicle capacity
→ Distributor credit limit management with automated alerts
→ Electronic proof of delivery integration at primary level
→ Predictive ordering suggestions based on historical purchase patterns

Development & QA Notes

- ACCOPS VPN access required for Admin Portal in production — raise GetIt request
- All bulk uploads are XLSX max 2MB — test file size validation and error reporting
- Network file mapping is critical for routing — test invalid distributor-site combinations
- FTL progress bar on cart: validate calculation accuracy for mixed SKU carts
- Balance check API: Test edge cases — zero balance, credit limit exactly met, overage

5. SOP — Primary Ordering by Distributor (Secondary Review)

TYPE: SOP	PLATFORM: Distributor Web Portal	USER: Distributor
-----------	----------------------------------	-------------------

Summary

This SOP details how distributors use the DMS platform to view retailer (secondary) orders placed by CSOs and to place their own primary orders with RCPL. The distributor platform is the central hub for order action-taking — accept, modify, reject — and invoice/picklist management.

Scope (Current) — Distributor Secondary Order Management

Secondary order actions available
→ View latest 3 orders on homepage; 'View All' to see full order list with filters
→ Filter orders by: All, Pending, Accepted, Rejected, Returned, Partially Returned; by Day/Week/Month/Date Range
→ Accept order — status changes from Pending to Accepted
→ Reject order — must select rejection reason
→ Modify order — change quantities per article; new order auto-created for any reduction
→ Download Invoice per order or Bulk Invoice download
→ Download Picklist per order or Bulk Picklist download (with beat-level grouping)
→ Bulk picklist by date range — grouped by beat name (unbeated orders shown as 'no beat')

Scope — Future

Future distributor platform enhancements
→ Returns processing from distributor side — initiate and track returns
→ Inventory management integration (now separate — see Distributor Inventory Visibility doc)
→ Live delivery tracking for dispatched orders
→ Reconciliation dashboard — outstanding payments by retailer
→ Automated reorder suggestions based on retailer order frequency
→ WhatsApp/SMS invoice sharing to retailers directly from platform

Development & QA Notes

- Modify flow: When distributor reduces quantity, test auto-creation of new order for the difference
- Bulk download: Test with large order volumes (100+ orders) for performance
- Beat mapping in picklist: Test retailers with no beat assigned — should show as 'no beat'
- Invoice and picklist auto-generation on order acceptance — test for tax computation accuracy

6. BN — Distributor Inventory Visibility Dashboard

TYPE: Business Requirement Note

STATUS: Design/Build Phase

USER: Distributor + Business Team

Summary

This BRD addresses a critical gap: RCPL currently has no visibility into what stock distributors hold. This leads to blind spots in forecasting, stockouts unknown to central planning, and inability to optimize replenishment. The solution is a real-time distributor inventory dashboard with initialization, GRN, secondary order management, and cycle count capabilities.

Problem Statement

Current pain points
→ Distributor stock levels are invisible to RCPL central team
→ Stockouts not visible — replenishment team cannot act proactively
→ No system for distributor to declare or update inventory
→ Industry benchmark (HUL, P&G) — distributor inventory visibility is standard
→ Blind spots across the value chain prevent precision forecasting

Scope (Current — Phase 1)

User Story	Capability
US 1: Add Inventory	One-time inventory initialization — search by article code, auto-populate description, submit to populate dashboard
US 2: Inventory Dashboard	Real-time view of Stock on Hand, Sellable, Allocated, Route Stock, Expired, Damaged/Missing; Low Stock alerts with safety stock calculation
US 3: Primary Order Management	View orders to RCPL — All, In-Transit, Received, Rejected/Returned; Manual GRN entry to add to sellable stock
US 4: Secondary Order Management	Auto-process pending retailer orders; partial allocation handling; FIFO-based inventory depletion; dispatch with loadout number generation
US 5: Cycle Count	Manual inventory reconciliation — locks primary/secondary processing; OTP confirmation on submission; downloadable audit trail Excel
US 6: Order Placement vs Inventory	CSO/Distributor can only process secondary orders if sellable inventory is available — OOS articles shown as Out of Stock

Key Inventory Definitions

Inventory Type	Definition
----------------	------------

Sellable Stock	Available for allocation to orders, loading to vans, inventory adjustments
Allocated Stock	Blocked for pre-sell orders awaiting delivery — not sellable unless orders rejected
Route Stock	Stocks loaded into vans for Ready VAN Sales or pre-sold deliveries — becomes 0 after billing or trip closure
Expired Stock	Auto-moved based on: Expiry Date = MFG Date + Expiry Window; if Remaining Age $\leq 0 \rightarrow$ Expired
Damaged Stock	Moved by distributor with reason codes: WH Handling Damage, Inbound Transit Loss, Shortage, Market Return Damages
Low Stock	If (Sellable + Allocated + Route) < Safety Stock — triggers alert; Safety Stock = Moving Avg (30 days) $\times$ Safety Day Norm (14)

Scope — Future

Phase 2+ enhancements
→ Automated GRN from RCPL despatch advice (ASN integration — currently manual only)
→ Inter-distributor transfer tracking
→ Expiry management — proactive alerts before expiry window closes
→ Demand forecasting at distributor level using historical sales
→ Integration with van sales / pre-sell delivery for real-time route stock updates
→ RCPL central dashboard aggregating inventory across all distributors by SKU/region

Development & QA Notes

- Inventory initialization: One-time feature — access must be controlled from backend per distributor
- FIFO depletion: Unit test inventory lot selection by manufacturing date
- Expiry calculation: Test edge cases — MFG date not provided, products with no expiry window
- Safety stock formula: Validate moving average calculation, especially for SKUs with ≤ 1 daily avg sales
- Cycle count locking: Test that order processing is blocked correctly during active cycle count
- Prototype available:
<https://inventory-management-tau-flax.vercel.app/inventory/dashboard>

7. BN-73 — Pre-Sales Last Mile Delivery & Settlement

TYPE: Business Requirement Document

MODULE: Pre-Sell Delivery

USER: Distributor + Driver + CSO

Summary

This BRD defines requirements for the Pre-Sell Delivery module within DMS. Pre-sell means orders are captured by CSOs ahead of delivery (vs. van sales where the driver sells stock on the route). This module covers order confirmation, van load planning, delivery execution, exception handling, billing, and end-of-day settlement.

Scope (Current)

Pre-Sell delivery capabilities
→ Order Review & Confirmation: Distributor views pending pre-booked orders (Cases + Eaches), sorted by creation date/time
→ Order editing: Adjust quantities, add/remove SKUs, apply cash discounts, merge duplicate orders
→ Stock reservation: On confirmation, price and quantity frozen; stock reserved for next-day delivery
→ Van Loadout Creation: System shows total deliveries, weight, case count; group by CSO/geography; assign vehicle, driver, CSO
→ Driver delivery: Access pre-booked orders on device or pre-printed bills; per-order bill generation
→ Payment capture: Cash, UPI, Cheque, Credit, AIDA coupon; UPI reference number capture
→ Exception — Retailer declines: Cancel order, stock auto-released back to open inventory
→ Exception — Partial delivery: Cancel full bill, release stock, create new bill for desired qty
→ Settlement: Cancel incomplete deliveries, release stock, check-in remaining open stock, generate Daily Settlement Summary

Functional Requirements Breakdown

Module	Key Requirements
5.1 Order Review	List view sorted ascending by creation time; edit qty, remove/add SKUs; merge duplicate outlet orders; confirm/reject
5.2 Van Load Prep	Dynamic weight + case count display; group by geography; assign vehicle, driver, CSO; auto-generate loadout ID
5.3 Delivery Execution	Lock by Customer-Order combination; GST/Non-GST bill; AIDA Grab Deal discount; MOP capture; UPI ref no.

5.4 Exception Handling	Decline → release stock; Partial → cancel bill, release, create new; released stock available for ready-stock orders
5.5 Billing	Pre-printed bills AND mobile bills (higher priority); digital sharing via WhatsApp; thermal printer support
5.6 Settlement	Daily Settlement Summary: delivered vs cancelled, payments by mode, outstanding receivables, UPI/cheque/AIDA tracking

Scope — Future

Future Pre-Sell enhancements
→ Real-time GPS tracking of delivery van on route
→ Retailer self-service confirmation via SMS/WhatsApp before delivery
→ Automated route optimization for van loading
→ Integration with AIDA platform for real-time coupon validation
→ Digital signature capture on delivery
→ Weekly/monthly settlement reports with trend analysis

Development & QA Notes

- Order merge logic: Test merging duplicate orders from same outlet — ensure correct quantity aggregation
- Stock reservation: Test race condition when multiple distributors try to reserve same stock simultaneously
- Mobile bill: Test non-editable constraint — bill should not allow quantity changes post-dispatch
- Thermal printer support: Define and test approved printer list; thermal print format for bill
- Daily Settlement Summary: Validate totals reconcile with individual transaction records
- AIDA coupon: Define coupon validation flow and test coupon reuse prevention

8. CTS — Cooler Tracking System SOP

TYPE: SOP

PLATFORM: Multi-portal +
Mobile App

USER: FOS/CSO → ASE/ASM →
BPO → Service Provider

Summary

The Cooler Tracking System (CTS) is an end-to-end asset lifecycle management platform for RCPL coolers deployed at retailer outlets. It tracks every cooler from request initiation through approval, compliance, allocation, dispatch, delivery, installation, and final agreement closure — with 10 distinct stakeholder roles.

End-to-End Workflow

Stage	Actor → Action
1. Request Initiation	FOS/CSO — raises asset request for retailer with PAN, GSTIN, asset type, ID/address proof, business volume
2. First-Level Approval	ASE/ASM — review, validate, modify asset type/subtype, approve or reject with reason
3. Compliance Check	BPO Customer — verify documents; if SAP code exists → auto-compliant; if not → create SAP Customer Code
4. Service Provider Allocation	CDE — assign service provider based on retailer location and SP capacity
5. Execution Setup	Service Provider — download GRN template, upload asset details (site code, model, serial no.), trigger CCO creation
6. CCO Generation	BPO CCO — create CCO number in SAP, update back into the request
7. Dispatch Documentation	BPO Delivery — create delivery challan, e-way bill, enter PGI and shipment numbers, upload documents
8. Delivery & Installation Assignment	Service Provider — assign Delivery Agent + Driver + Service Engineer; notify via DMS mobile app
9. Cooler Delivery	Delivery Person — deliver asset, upload POD, complete OTP verification with retailer, collect signed agreement
10. Cooler Installation	Service Engineer — log in to mobile app, scan QR/enter asset number, complete installation checklist, get OTP from retailer
11. Agreement Upload	Service Provider — upload signed agreement; status → 'Agreement Uploaded'
12. Final Verification	BPO Verifier — review agreement, enter customer feedback, approve for closure; reject → back to SP for correction

Scope (Current)

CTS current capabilities

→ Multi-role digital workflow replacing paper-based cooler deployment process
→ SAP Customer Code auto-creation for new retailers via BPO Customer team
→ GRN template for asset registration — auto-deducts from site storage
→ CCO number generation in SAP with back-sync into DMS
→ E-way bill and delivery challan creation by BPO Delivery team
→ QR code scanning for cooler identity verification at installation
→ OTP-based delivery and installation confirmation
→ Customer feedback capture by BPO Verifier at closure
→ Rejection workflow at every stage with reason codes

Scope — Future

CTS future enhancements
→ Cooler health monitoring (IoT integration — temperature, power usage)
→ Automated alert for cooler servicing/maintenance cycles
→ Cooler relocation tracking — movement from one outlet to another
→ Customer satisfaction scoring from feedback data
→ End-of-contract cooler retrieval workflow
→ Asset depreciation and financial lifecycle tracking

Development & QA Notes

- Test SAP auto-compliant path (existing SAP code) vs. new SAP code creation path — both must route correctly
- GRN upload: Validate asset serial number uniqueness; test duplicate submission prevention
- CCO back-sync: Test failure handling if SAP is unavailable during CCO creation
- OTP delivery confirmation: Test with retailer number unreachable — must provide manual override process
- Agreement rejection: Test multi-round rejection/resubmission cycles
- Mobile app: Delivery Person and Service Engineer use same app (rcpl.jmpx3.de) — test role-based view separation

9. SOP — Article Creation

TYPE: SOP

PLATFORM: Jio Commerce CMS

USER: Product / Catalog Team

Summary

This SOP describes how to create articles (products) in the Jio Commerce CMS platform and make them available for ordering on the DMS. It covers single and bulk article creation, image upload, inventory mapping, article market mapping, distributor-category mapping, article dimension definitions, and L2 category filtering setup.

Platform URLs

Environment	URL
UAT	https://platform.jmpx3.de/
Production	https://platform.jiomartpartners.com/
CMS Admin (Attributes)	https://administrator.jiomartpartners.com/administrator/company-details/55
Admin Panel (Article Market Mapping)	https://portal.reliancedms.com/login

Scope (Current)

Article creation and management capabilities
→ Single article creation: Name, Item Code, Brand, L3 Category, HSN Code, Country of Origin, GTIN, MRP, Dimensions, Tags
→ Bulk article creation via Excel template (L3 category-specific templates)
→ Single and bulk image/video upload per article
→ Bulk inventory mapping: Store code to article mapping with quantity 99999999, expiry date, tags
→ Article Market Mapping via Admin Panel (Catalogue & Team Mapping → Article-Market Mapping)
→ Distributor-Category Mapping upload via Admin Panel
→ Article Dimension file: define ordering units available for Primary, Secondary, or Both
→ Tags definition: BEVERAGES, FMCG, STAPLE — mandatory for article to appear on platform
→ L2 Category attribute setup per template for product listing page filter

Key Article Fields Reference

Field	Value / Rule
Report HSN Code	HSN Number + H1 suffix (e.g., 124578632H1)
GTIN Type / Value	SKU / Article Code
Seller Identifier	Article Code
Size	OS (One Size)
Product Dead Weight	Extract number from article name (e.g., INDEPENDENCE WATER 750 → 750)
Net Qty Unit	ml, g, etc. based on product
Available	Yes
Trader Type	Manufacturer
Return Time Limit	15 Days
Tags (Mandatory)	BEVERAGES / FMCG / STAPLE
Store Code (Inventory)	RCPL — required for DMS visibility
Quantity (Inventory)	99999999

Scope — Future

Future article management enhancements
→ Automated HSN code lookup/validation
→ AI-assisted article description generation
→ Bulk image processing with auto-crop and optimization
→ Product lifecycle management — activation, deactivation, replacement SKU flows
→ Price change management with effective date scheduling
→ Real inventory stock sync replacing the 99999999 placeholder approach

Development & QA Notes

- Template selection is L3 category specific — if exact template missing, raise with Jio team to create
- Tags are now consumed by platform for article fetching — unmapped articles will not appear in orders
- L2 category attribute must be added to ALL relevant templates before bulk L2 upload
- Pricing cron must be run after pricing uploads (UAT: manual curl; Prod: automated)
- Finance team uploads pricing; Product team runs retailer price cron state-wise; L1 team runs distributor price cron

10. Pricing User Manual

TYPE: User Manual

PLATFORM: Admin Portal

USER: Finance / Pricing Team

Summary

This manual describes how to set up the complete pricing hierarchy in the DMS Admin Panel. Pricing flows from Retailer Margin → Distributor Margin → Anchor Distributor Margin, with Scheme Rules layered on top at all three levels. Virtual groupings allow applying rules to groups of distributors or articles.

Scope (Current)

Pricing setup capabilities
→ Retailer Margin Rules — base pricing for all retailers
→ Distributor Margin Rules — pricing for standard distributors
→ Anchor Distributor Margin Rules — pricing for anchor/priority distributors
→ Retailer Scheme Rules — promotional schemes at retailer level
→ Distributor Scheme Rules — promotional schemes at distributor level
→ Anchor Distributor Scheme Rules — schemes for anchor distributors
→ Virtual DB Grouping — group distributors for bulk rule assignment
→ Virtual Article Grouping — group articles for bulk rule assignment
→ Upload → validate → log review → error file download on failure

Pricing Upload Flow

Step	Action
Step 1	Login to Admin Panel (UAT: https://jio-dms-service.extensions.jmpx3.de)
Step 2	Go to Data Upload → Select Template Type: Pricing
Step 3	Set up Retailer Margin first (Sub-Type: Retailer Margin Rules) — this is the base
Step 4	Download template, refer to sample data, fill and save
Step 5	Upload → check logs for Success / Failed / Partial status
Step 6	On failure: download error file to see specific row/column errors
Step 7	Set Distributor Margin Rules and Anchor Distributor Margin Rules
Step 8	Set Retailer/Distributor/Anchor Distributor Scheme Rules
Step 9 (UAT only)	Run pricing cron manually via curl command to reflect prices
Step 10	Create Virtual DB Groups (Sub-Type: Virtual DB Grouping) for group pricing

Step 11	Create Virtual Article Groups (Sub-Type: Virtual Article Grouping) for article-level grouping
----------------	---

Pricing Hierarchy

Level	Details
Retailer Margin	Base margin — must be set first; foundation for all downstream pricing
Distributor Pricing	Set after retailer margin; can be overridden by Virtual DB Group pricing
Anchor Distributor Pricing	Premium pricing tier for designated anchor distributors
Scheme Rules	Applied on top of margin rules at each level — ladder schemes, fixed discount, buy-get schemes
Virtual DB Grouping	Group distributors by geography or tier; apply single rule to entire group
Virtual Article Grouping	Group articles by brand/category; apply pricing rule across multiple SKUs at once

Scope — Future

Future pricing enhancements
→ State-wise pricing automation — currently requires manual cron trigger per state
→ Pricing effective date scheduling — ability to pre-schedule price changes
→ A/B testing framework for scheme effectiveness measurement
→ Automated conflict detection — flag overlapping scheme rules
→ Price deviation alerts — notify if new pricing deviates significantly from previous
→ Pricing audit trail — full history of who changed what and when

Development & QA Notes

- Retailer Margin **MUST** be set before Distributor/Anchor Distributor margins — test enforcement of this dependency
- Pricing cron in UAT: manual curl trigger; validate cron auto-runs in production
- Virtual Group IDs: Test that group IDs correctly reference the right distributors/articles in rules
- Error file: Validate that error file clearly identifies row number, column, and error reason
- Scheme stacking: Test what happens when both margin rule and scheme rule apply — ensure no unintended double discounts

Consolidated Project Roadmap

Overall DMS Maturity — Phase View

Phase	Scope
Phase 1 — Foundation	Distributor onboarding, primary ordering, basic secondary ordering, CSO app, retailer onboarding, admin panel, pricing setup
Phase 2 — Expansion	Signature retailer program, CTS cooler tracking, Saarthi assisted ordering, pre-sell delivery module
Phase 3 — Intelligence	Distributor inventory visibility dashboard, real-time stock sync, GRN automation, safety stock alerts, cycle count
Phase 4 — Optimization	Predictive ordering, route optimization, IoT cooler monitoring, automated pricing, settlement automation

Module Dependency Map

What must be set up before each module can function
→ Admin Panel (all uploads) → Required before ANY module can go live
→ Pricing setup → Required before orders can be placed (secondary or primary)
→ Article creation in CMS → Required before orders can be browsed or placed
→ Distributor onboarding → Required before Primary Ordering, Saarthi, and Distributor Platform can work
→ CSO onboarding + beat plan → Required before CSO App secondary ordering can begin
→ Retailer onboarding → Required before secondary orders can be placed to that retailer
→ Signature retailer flow → Requires standard onboarding + Approval Panel access
→ Inventory Visibility → Requires GRN flow + secondary order management to be functional
→ Pre-Sell Delivery → Requires inventory visibility + van loadout to be operational
→ CTS Cooler Tracking → Requires retailer onboarding + SAP integration + service provider onboarding

QA Testing Matrix — Cross-Module

Test Area	Critical Test Scenarios
OTP Flows	CSO login, retailer onboarding, distributor login, Saarthi login, BPO panels — all OTP-based; test expired OTP, resend OTP, wrong OTP
Bulk Upload Validation	All Admin Panel uploads — test: correct file, wrong format, missing mandatory columns, exceeding 2MB, partial failure rows
Pricing Cron	Prices visible to distributor/retailer only after cron runs; test stale price

	before cron vs. updated price after
Stock Reservation	Pre-sell flow: confirm order → stock reserved → order cancelled → stock released back to sellable
Order Lifecycle	Pending → Accepted/Modified/Rejected → Invoice generated → Picklist generated — test each transition
Role-Based Access	Admin Panel: Each designation sees only their allowed upload sub-types; Approval Panel: ASM sees only their territory
GSTIN Validation	Signature onboarding: valid GSTIN auto-populates; invalid GSTIN shows error; Non-GST path skips validation
Penny Drop	Signature onboarding: correct bank details → validated; incorrect → retry logic; failed after N retries → escalation
FTL Calculation	Primary ordering: cart weight/volume matches truck capacity; proceed button activates only at FTL
Beat Sync	CSO app shows correct retailers for today's beat after Admin Panel upload; test day change at midnight
CTS Workflow	Test all 12 stages with happy path and rejection at each stage; test SAP code auto-compliant path
Inventory FIFO	Distributor Inventory: order allocation depletes oldest manufacturing date lot first
